

UNICIMA USER GUIDE

Created by: FirmanPhntom68 – BitType Studio

DISCLAIMER

Unicima is not an encryption system. It does not provide any data security. It only *looks like* a cipher, but is purely a creative symbolic font system.

INTRODUCTION

Unicima is more than just a font. It is a symbolic writing system with its own logic and codes. This guide explains the syntax used in Unicima.

A. CobolType - Coded Based Orthographic Language

Unicima replaces regular numbers (0–9) with unique symbolic names called Cobols.

Number	Cobol	Sounds Like
1	 (Setto)	/'set.tou/
2	 (Duwa)	/'du.wa/
3	 (Tello)	/'tɛl.loʊ/
4	 (Empa)	/'ɛm.pa/
5	 (Lema)	/'lɛ.ma/
6	 (Menne)	/'mɛn.nɛ/
7	 (Petto)	/'pɛt.tou/
8	 (Bello)	/'bɛl.loʊ/
9	 (Sanga)	/'sæŋ.ɡɑ/
0	 (Nol)	/nɔl/

B. SyntaFinder – Syntax Finder

A marker to call a symbol using its Unicode decimal value.

Example:

  → !

   → !

C. Negation – External Symbol Marker

Used when the character doesn't exist in Unicode.

Format:

  [code] 

Example:

        → §k

D. Meaning – Adding Notes to Symbols

Same structure as Negation but adds meaning using footnotes.

Format:

  [code]  [meaning in Cobol] 

Example:

F. Majh – Encoded Link (Obfuscated)

While I share this font openly, I kindly ask that future use or development avoids areas that go against the ethical values of Islam — as understood by the early generations of Muslims (Salaf), who emphasized purity, modesty, and meaningful creativity. I have no control over how others use it, but I share it with good intentions — hoping Unicima can inspire creativity in respectful and thoughtful ways, across cultures and beliefs.
